# PowerEnfo

PowerEnfo™ is a cloud powered, web-based service that provides real-time energy monitoring via a mobile phone, tablet, laptop or desktop device. PowerEnfo will provide user-friendly and customer-defined energy data from anywhere – analyzed, delivered and ready to share.

The Problem »

Monitoring energy use is time-consuming, complicated and confusing.

Analyzing energy data effectively distracts from other critical building-management responsibilities. Gathering data from a variety of sources and measuring it against energy costs can be misleading and can create costly errors.

Currently, no simple, single resource provides useful information in real-time that can guide day-to-day management decisions without a significant investment of staff time.

The Solution »

PowerEnfo provides a dashboard that is easy to understand and allows you to monitor in real-time the energy being used in your facility.

- First of its kind event-based energy reporting
- Provides relevant and timely energy information
- Driven by cloud based advanced machine learning algorithms
- In addition to a dashboard, notifications can be pushed directly to you in real time via email or text message
- Able to monitor various commodity types including electricity, natural gas and water

PowerEnfo provides the active intelligence that managers need, allowing them to understand it and respond appropriately.

- Expands the ability to monitor, measure and control in real time
- Eliminates deciphering busy dashboards and spreadsheets

With PowerEnfo, managers can devote their time to the strategies that will provide the most savings for their company.
